ABSTRACT

Knowledge Management plays an important role in any organization by facilitating the capture, storage, transformation, and dissemination of knowledge in order to achieve organizational goals. It is a collaborative and integrated approach adopted on an organization-wide basis to ensure that an organization’s knowledge assets are best utilized to increase organizational performance. Universities as ‘knowledge intensive’ organizations thrive on the production and dissemination of knowledge which calls for its professional management. Effective management of this knowledge can only happen when well-established platforms exist, that have clearly laid down strategies and policies on how employees can share their know-how. Communities of practice is a knowledge management practice that can be used to encourage knowledge sharing among employees in universities. Through descriptive research design, the study examined the influence of communities of practice on employee performance in public universities in Kenya Simple regression analysis revealed a positive and significant influence of communities of practice on employee performance in public universities in Kenya.

Keywords: Communities of practice; Knowledge sharing; Employee Performance

1.0 INTRODUCTION

Communities of Practice (CoPs) are groups of people, who share a common interest in a particular area of knowledge, and learn by exchanging and sharing ideas as they interact regularly on how they can perform better as professionals, (Mohajan, 2017). CoPs not only provide a forum for individuals to learn from each other, it also focuses on the daily challenges at work, building creative and innovative ideas for improving ways and tools of working and developing issues in the particular field and identifying what has been obsolete and what remains relevant. Secondly, for organizations to remain invincible in the face of competition, they need to access all kinds of knowledge, (Lei, 2014).

This can only occur if regular interactions and sharing of knowledge take place between experts. Thirdly, CoPs have received recognition as important pathways for KM to promote the development of an organization’s intellectual capital. This is done through supporting and encouraging knowledge-sharing platforms and putting in place policies that encourage continuous learning and development among employees (Mohajan, 2017).
Universities hire professionals with varied expertise whose primary role is to contribute to the generation and improvement of new and existing knowledge (Mugalavai & Muleke, 2016). Since they are known to be knowledge organizations, it is imperative for them to improve how they manage their knowledge to be able to react appropriately to emerging issues within their competitive environments.

These environments both experience rapid developments and changes which require the establishment of inbuilt capabilities to respond to and manage the forces of change, (Kilika, et al., 2012). This implies that the management of the knowledge workers needs to be well organized and coordinated so that as professionals they are able to see value in participating in sharing platforms like CoP and the universities also stand to gain by encouraging the practice.

It is important that the balance between the implementation of KM practices and institutional objectives is handled tactfully. There is a risk that if the KM practice is too broad then it may lack adequate ownership from relevant individuals since expectations may be unclear to many and may ultimately seem like a top management-driven initiative. Similarly, if the initiative is too narrow, then it may stifle adequate levels of interactions between the experts to achieve desired outcomes, (Venkatraman & Venkatraman, 2018). It is important to mention that the basis of developing CoP is to not only enrich interactions internally and externally so that institutions get access to useful knowledge, but also to enrich their capacity to build creativity and innovation ideas by sharing valuable knowledge for its current and future needs (Dobrai, 2011).

According to Wenger and Wenger (2015), interactions between employees play an important role, especially in view of the tacit knowledge which is largely personal and is not easily shared or exchanged unless it is within a suitable context or environment that encourages that to happen. Many studies aforementioned (Venkatraman & Venkatraman 2018; Wenger & Wenger, 2015), all agree that knowledge can be generated in different ways be it through training, education, experience, or sharing among others in the context of interacting as a group both within and outside the institution.

This study proposes to measure the extent to which universities can foster collaborations/alliances both internally and externally as ways of improving their employee’s knowledge base which includes, partnerships with other institutions, attendance at conferences and seminars, and benchmarking, among many others (Bolisani & Scarco 2014).

2.0 THEORETICAL AND EMPIRICAL LITERATURE

2.1 Knowledge-Based View

This theoretical concept is of the view that knowledge has a life cycle in terms of its applicability within an organization or in the external environment as professional knowledge. The focus of this study is on the use of knowledge for organizational for internal purposes. As an outgrowth of the resource-based view, the knowledge-based view focuses on knowledge as the most strategically important of the firm’s resources (Cheng, Wang & Qu, 2020). According to this view, its rationale is based on the fact that certain key decisions need to be made by the top management regarding the management of knowledge.
One decision is on the development of professional knowledge internally and modalities of doing it with an option of when it would be desirable to draw upon external expertise, and internal and external knowledge when jointly used through consultants. A third could be on how the internal knowledge can be marketed beyond organizational boundaries (Salina & Wan Fadzilah, 2010). This study focused on how internal knowledge can be leveraged through the use of communities of practice and knowledge mapping, within a culture and structure that encourages knowledge sharing. Recent studies have pointed out the role of knowledge management (KM) and employees’ knowledge-sharing practices (Singh, 2019) in the enhancement of firm performance and the development of a firm’s competitive advantage (Santoro, Bresciani & Giudic, 2019)

This view further proposes that the aforementioned decisions and others can only be effective if organizational members are accorded professional support in their day-to-day activities which include clarity of instructions, free flow of information, constant review and improvement of recurring tasks, and transparent coordination techniques, (Salina & Wan Fadzilah, 2010). Furthermore, a study by Aminga (2015), recommends the implementation of KM practices policy to improve institutional accountability and performance in public universities in Kenya. Another study by Gichuhi, (2014) also recommends the adoption of KM strategies to empower employees with techniques of creating and utilizing their knowledge. All these basic functions were aligned to the objectives of this study which were focused on combining management of employee core competencies within a knowledge culture and supportive structures of communities of practices, knowledge mapping, and organizational learning.

2.2 Communities of Practice and Employee Performance

Communities of Practice (CoPs) are informal groups of people who engage in social learning on a subject of common interest for a period of time which may be medium or long term and in the process share ideas on how they can improve specific aspects of doing things in the shared concern, (Laves, 2014). A study by Chong, Yen & Gan, (2014) on the Strategies and Barriers of knowledge sharing among faculty in universities in Malaysia concluded that performance evaluations that were deemed fairly done and rewards that were non-financial in nature were associated with knowledge sharing intentions in private universities while financial rewards and recognition, opportunities to research and publish influenced the same in public universities. This implies that employees do require some level of motivation to share and participate in CoPs.

According to Lopez-Saez, Real, and Valle, (2010) who studied the utilization of the Socialization, Externalization, Combination, and Integration (SECI Model), on KM processes concluded that the management of tacit knowledge requires a different approach from the management of explicit knowledge because of its inherent nature, embedded in the human mind. This approach the study revealed must be appealing to such an extent that the individual develops a desire to share it. CoPs are viewed as one of the ways of promoting innovation by facilitating the sharing of tacit knowledge within a group.

A study by Bagaja and Guyo, (2015) on the impact of sharing knowledge on the performance of public universities in Kenya showed that the sharing practice among employees in the
institutions can only be effective if there is a major change in employee behavior and the organizational culture. This is echoed by a study by Israilidis, Siachou, Cooke & Lock (2015), which sought to identify the factors that affect knowledge sharing in a multinational organization. The study found that employees’ ignorance of the benefits of sharing knowledge is likely to hinder their willingness to share it which has a negative impact on the organization’s performance.

The study concluded that lack of awareness limits the ability of an individual to appreciate the impact of changes in the environment due to their poor adaptability skills. Employees’ performance relies to a large extent on what they know, and are able to do, which can then be enriched by engaging in knowledge-sharing activities like CoPS, being trained, or attending seminars and conferences, (Small & Sage, 2009). Understanding individual variables that contribute to knowledge-sharing behavior is important if public universities are to manage their knowledge assets effectively for improved performance.

According to a study by Loyarte and Riveria (2007), on a Model of Communities of Practice, results showed that CoPs have a significant relationship with the performance of individuals by providing them with a forum for knowledge sharing with professional colleagues. The study created a model which included the detection, analysis and evaluation of CoPs in organizations. A study by Schenkel & Teigland, (2008) on improved organizational performance through CoPs in a construction project in Sweden revealed that those CoPs that operated under stable conditions showed a marked improvement in their performance. However, the one CoPs that was exposed to a change in its communication channels never quite bounced back to its original status of coming up with innovative ideas. The relationship between channels of communication and performance was therefore found to be significant in CoPs.

According to Mugalavai and Muleke, (2016) study on CoPs in selected public universities in Kenya, findings indicated that although a high volume of knowledge is generated within the institutions, there were insufficient sharing mechanisms in place to enable the knowledge creators to contribute to the existing body of knowledge. This was attributed to a lack of recognition and incentives to do so and recommended the development of a knowledge-sharing model to suit the needs of the institutions.

The benefits of CoPs on employee performance have been demonstrated as significant, particularly in relation to sharing of knowledge. CoPs enrich personal skills; facilitates the build-up of networks and collaborations; group members develop a standard language; and develop a professional code of ethics that members must follow, (Dobrai, 2011). As organizations that are primarily engaged in the knowledge business, public universities in Kenya need to constantly improve the management of their knowledge in order to respond effectively to the rapid changes that occur in their environments and remain relevant by investing in the development of CoPs as a KM practice.

3.0 RESEARCH METHODOLOGY

3.1 Research Design
Research design is the conceptual structure within which research is conducted; it constitutes the blueprint for the collection, measurement, and analysis of data, (Kothari 2013). Further, Oso and Onen (2009) posit that through descriptive research design, questions pertinent to what is happening, how it has happened, and why it has happened can be answered. Cooper and Schindler (2011), further indicate that a descriptive study is concerned with finding out the what, where, and how of a phenomenon. The study used a descriptive research design since it will enable the researcher to generalize the findings to a larger population to obtain information concerning the current status of the phenomena and to describe "what exists”.

3.2 Target Population

The complete enumeration of all the elements under consideration in a study is known as the target population, (Polit & Beck, 2004). According to Commission for University Education (CUE) website (www.cue.or.ke), Kenya has 31 public chartered Universities. The target population was drawn from employees working in the 10 chartered public universities in Kenya which is estimated at 495 based on information obtained from the university websites. The unit of analysis was 10 selected public universities using the criteria of those which have been in existence for more than 10 years.

3.3 Sampling Frame and Techniques

A sampling frame is a complete list of all the members of the population that we wish to study. The sample is a subset of the total population which is selected to be the true representative of the target population. A sample is selected through the sampling process (Oso & Onen, 2009). The sampling technique can be either probabilistic or non-probabilistic, in the former; there are equal chances of being selected while in the latter the respondent is selected through subjective criteria (Kothari, 2013).

The study used a stratified sampling method that uses a stratum which is a subset of the population that shares at least one common characteristic, (Kothari, 2013). This technique allows the researcher to perform a sound study on a small sample selected to provide information that is rich in the qualitative context in order to answer research questions and meet objectives. Additionally, the method has a higher statistical precision compared to simple random sampling because the variability within the subgroups is lower compared to the variations when dealing with the entire population. This also means that it requires a small sample size which can save a lot of time, money, and effort for the researchers. The sample size for students was calculated based on Yamane’s formula (Yamane, 1967).

\[ n = \frac{N}{1 + Ne^2}; \]
where, \( n \) = the sample size, \( N \) = the size of population, \( e \) = the error of 5 percentage points; \( n = 495/ (1+495*0.05^2) \) \( n = 221 \). By using Yamane formula with sampling error of 5% and 95% confidence intervals yielded a sample of 221 from a target population of 495. Resultant sample from each stratum will be distributed as shown in Table 3.1.

Table 3.1 Sample Size Public Universities - 10 years old and above
3.4 Data Processing and Analysis

After the data collection, the questionnaire was coded, entered, and analyzed using Statistical Packages for Social Scientists (SPSS) version 22. The social demographic characteristics of the respondents were analyzed using descriptive statistics. According to Brace, Kamp & Snelgar (2003), descriptive statistics are statistical tools used to summarize large volumes of data with very few figures. Simple regression analysis was carried out to show the nature of the relationship between employee core competencies and employee performance, (Kothari, 2011). The level of significance was tested at 5% whereby if the p value was less than 0.05 then there was enough evidence to reject the null hypothesis and accept the alternative hypothesis. A regression model was of the form:

\[ Y = \beta_0 + \beta_1 X_1 + \epsilon \]

Where; \( Y \) = Employee Performance, \( X_1 \) = Communities of Practice

4.0 FINDINGS AND DISCUSSIONS

4.1 Descriptive Statistics of Communities of Practice

The study determined the influence of communities of practice on employee performance in Kenya's public universities. Communities of Practice (CoPs) are informal groups of people who engage in social learning on a subject of common interest for a period of time which may be medium or long term and in the process share ideas on how they can improve specific aspects of doing things in the shared concern.

Concerning CoPs in Kenya public universities, the majority of 44.1 percent agreed and 30.2 percent strongly agreed that they represent an area of common interest for a number of staff/customers/clients/partners. Secondly, the majority 47 percent agreed and 34.7 percent strongly agreed that they currently have a clear focus on their organization's theme/mission. Thirdly, the majority means = 4.1 and standard deviation of 1.0 agreed that their CoPs accords them a sense of belonging. Further, the majority 41.6 percent agreed and 22.8% strongly agreed that CoPs aides in relationship building. Moreover, the majority of 46.5 percent agreed and 24.8 percent strongly agreed that CoPs help in networking.
Also, 42.1 percent agreed and 23.3 percent strongly agreed that they benefit in their daily work from relationships they have built. The majority agreed to a mean = 3.7 and a standard deviation of 1.2 that CoPs have enhanced their willingness to participate in university activities. The majority agreed 41.6 percent and 22.8 percent strongly agreed that CoPs have motivated them to share work-related knowledge. Further, the majority agreed to mean = 3.5 and a standard deviation of 1.2 that CoPs have broken down communication barriers amongst members. Finally, the majority 39.1 percent agreed and 36.1 percent strongly agreed that CoPs have built an agreed set of communal resources over time.

These findings mirrored the study of Chong et al., (2014) who reported that there is a need to develop measures that would enhance knowledge sharing amongst public and private universities citing both monetary and recognition factors being the main hindrances. If eliminated, the scholars added, employees would be willing to share knowledge in defined forums. Additionally, the study mirrored that of Lopez-Saez et al., (2010) that supported the need for building externally generated knowledge by developing institutional support for accessing the same. Indeed, such efforts will help in optimizing the use of resources to improve performance within organizations, (Bagaja & Guyo, 2015).

At the respective universities, 29.2 percent agreed and 29.7 percent strongly agreed that their respective employees are assisted to access important information through journals, research reports, etc. Secondly, the majority either agreed to mean = 4.1 that their institution purchased important information which was missing or employees were encouraged to share knowledge in line with their common areas of interest. Further, the majority mean = 4.0 agreed that they are either supported internally for example being allocated rooms for meetings, or employees were encouraged to join professional networking and associations. Also, the majority agreed to mean = 3.6 and a standard deviation of 1.2 that their employees were encouraged to be active in external professional networks and associations. On average majority agreed to mean = 3.8 and standard deviation = 1.1 that communities of practice had an influence on employee performance in their respective universities.

These findings collaborated with Israilidis et al., (2015) who argued that the inability of an organization to create knowledge-sharing platforms depicts its inability to access and take advantage of internal and external opportunities thus exposing it to potential threats and competition which affects performance at individual, group and organizational levels. Also, the findings mimicked those of Lovarte & Riveria (2007), whose model evaluates organization information needs and aligns it to the development of CoPs. Moreover, the creation of external links aids the employees to acquire current knowledge in the industry and contributes significantly to an institution’s ability to perform well by developing its knowledge spread. Schenkel & Teigland, (2008) further advocate for the creation of appropriate communication channels to promote the growth of harmonious knowledge-sharing platforms and alignment of information needs to its core competencies. In contrast, the study refuted findings by Mugalayai & Muleke (2016) who found insufficient knowledge generation within public universities in Kenya which was attributed to a lack of employee recognition for those who shared their knowledge. This was supported by a study by Thiga, (2012) which showed that dissemination practices in public universities require more improvement to by encouraging vibrant knowledge-sharing practices among employees. This
study showed that this situation has since changed since employees in public universities are encouraged to continuously generate and share their knowledge.

4.2 Communities of Practice has no Significant Influence on Employee Performance in Public Universities in Kenya

The hypothesis of the study stated that there was no significant influence of communities of practice on employee performance in public universities in Kenya. As shown in Table 4.2 regression model summary shows an R squared of 0.68, which depicts that 68 percent of changes in employee performance are significantly influenced by communities of practice in public universities in Kenya.

As shown in Table 4.4, there was a positive and significant influence of communities of practice on employee performance in public universities in Kenya (β=0.81, p-value <0.05). This shows that an increase in communities of practice increases employee performance by 0.81 units. These findings agreed with Chong et al., (2014) who found a positive and significant influence between knowledge sharing and employee performance. Similar sentiments were echoed by Bagaja and Guyo (2015) who found a significant influence of knowledge management practices and optimal resource utilization. Consequently, there is a need to support institutional needs as argued by Lopez-Saez et al., (2010) who found a significant positive contribution of institutional support to employee performance.

5.0 CONCLUSION AND RECOMMENDATIONS

Communities of practice which are groups of people who share a concern or a passion for something they do and learn how to do it better as they interact regularly were found to have a positive and significant influence on employee performance in Kenyan public universities. This implies that improved communities of practice enhanced employee performance in Kenyan public universities.

Thus, there is a need for more clarity on organization themes, mission and vision statements, development of inter and intra relationships among employees, and employees being encouraged to share their knowledge freely by creating environments that promote a kind of culture. Additionally, measures ought to be adopted to harmonize communication structures among departments in public universities to enhance accessibility to shared knowledge. Employees should also be accorded time and support to meet with peers both internally and externally.

Further, universities should improve employee information access to relevant journals, and missing information ought to be acquired in the shortest lead time. Employee participation in professional networks and bodies ought to be facilitated to enhance knowledge sharing and employee performance. Communities of practice were therefore seen as important in so far as they support the creation of knowledge and development of skills, provide access to new thinking and innovation, support the change management process, and promote effective sharing of knowledge.
